

# Explainable AI (XAI) Interpreting, Explaining and Visualising Machine and Reinforcement Learning

Alessandro Antonucci ([alessandro@idsia.ch](mailto:alessandro@idsia.ch))

Senior Lecturer-Researcher @IDSIA USI-SUPSI

*AIDD Spring School - Advanced Machine Learning for Drug Discovery*

*Lugano, May 12, 2022*

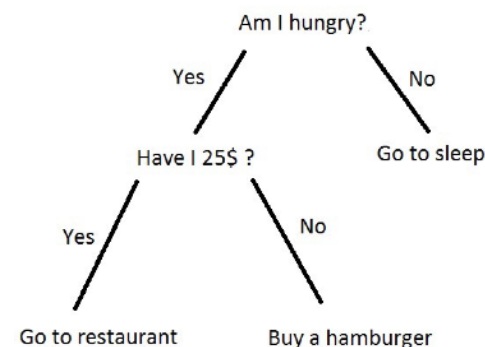

## Do we really need XAI? Decision Trees

- "Self-explanatory" ML algorithms?
- Decision Tree Classifiers = recursive splits of data by purity measures giving rule-based classifiers (for discrete/continuous)
- Simple-but-powerful idea: Random Forests & Gradient Boosted Trees are DTC sophistications

# A (Complicated) Explanation of the Iris Data Set with DTs

# A (Still Complicated) Explanation of the Iris Data Set with DTs

Informative, but only  
with "small" trees

Small tree = simple "rules"  
but ML is mostly used  
when rules  
are complex ...

## (Already) Interpretable Models

- Sparse or Low Dimensional **Linear** Models
  - Support Vector Machines (SVMs) line DTs with non-orthogonal separators
  - Regressors, NBC, etc., ...
- Rules can be obtained
- Linearity is often unrealistic, but kernel transformations leading to non-linear models can be used

	Conditions		Probability	Support
IF	IrregularShape AND Age $\geq 60$	THEN malignancy risk is	85.22%	230
ELSE IF	SpiculatedMargin AND Age $\geq 45$	THEN malignancy risk is	78.13%	64
ELSE IF	IllDefinedMargin AND Age $\geq 60$	THEN malignancy risk is	69.23%	39
ELSE IF	IrregularShape	THEN malignancy risk is	63.40%	153
ELSE IF	LobularShape AND Density $\geq 2$	THEN malignancy risk is	39.68%	63
ELSE IF	RoundShape AND Age $\geq 60$	THEN malignancy risk is	26.09%	46
ELSE		THEN malignancy risk is	10.38%	366

Table 1: Falling rule list for mammographic mass dataset.

## Generative Models (Bayesian Nets)

- Generative Modelling?  
Joint Probability  $P(C, F_1, F_2, F_3, F_4)$
- Classification?  
 $\arg \max_C P(C | F_1, F_2, F_3, F_4)$
- Explanations?  $P(F_j | C)$
- Joint Elicitation?  
Decomposition by independence

- E.g., Naive Bayes Classifier

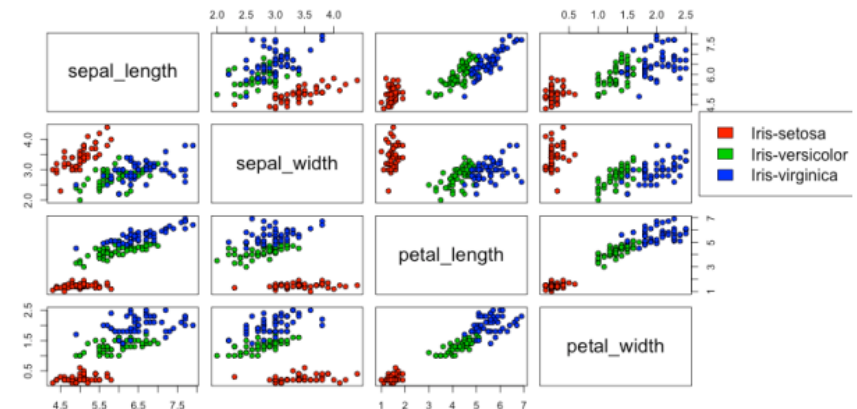

$$P(C, F_1, F_2, F_3, F_4) = P(C) \prod_{i=1}^4 P(F_i | C)$$

Naïve Bayes Classifier

$$P(A|B) = \frac{P(B|A) P(A)}{P(B)}$$

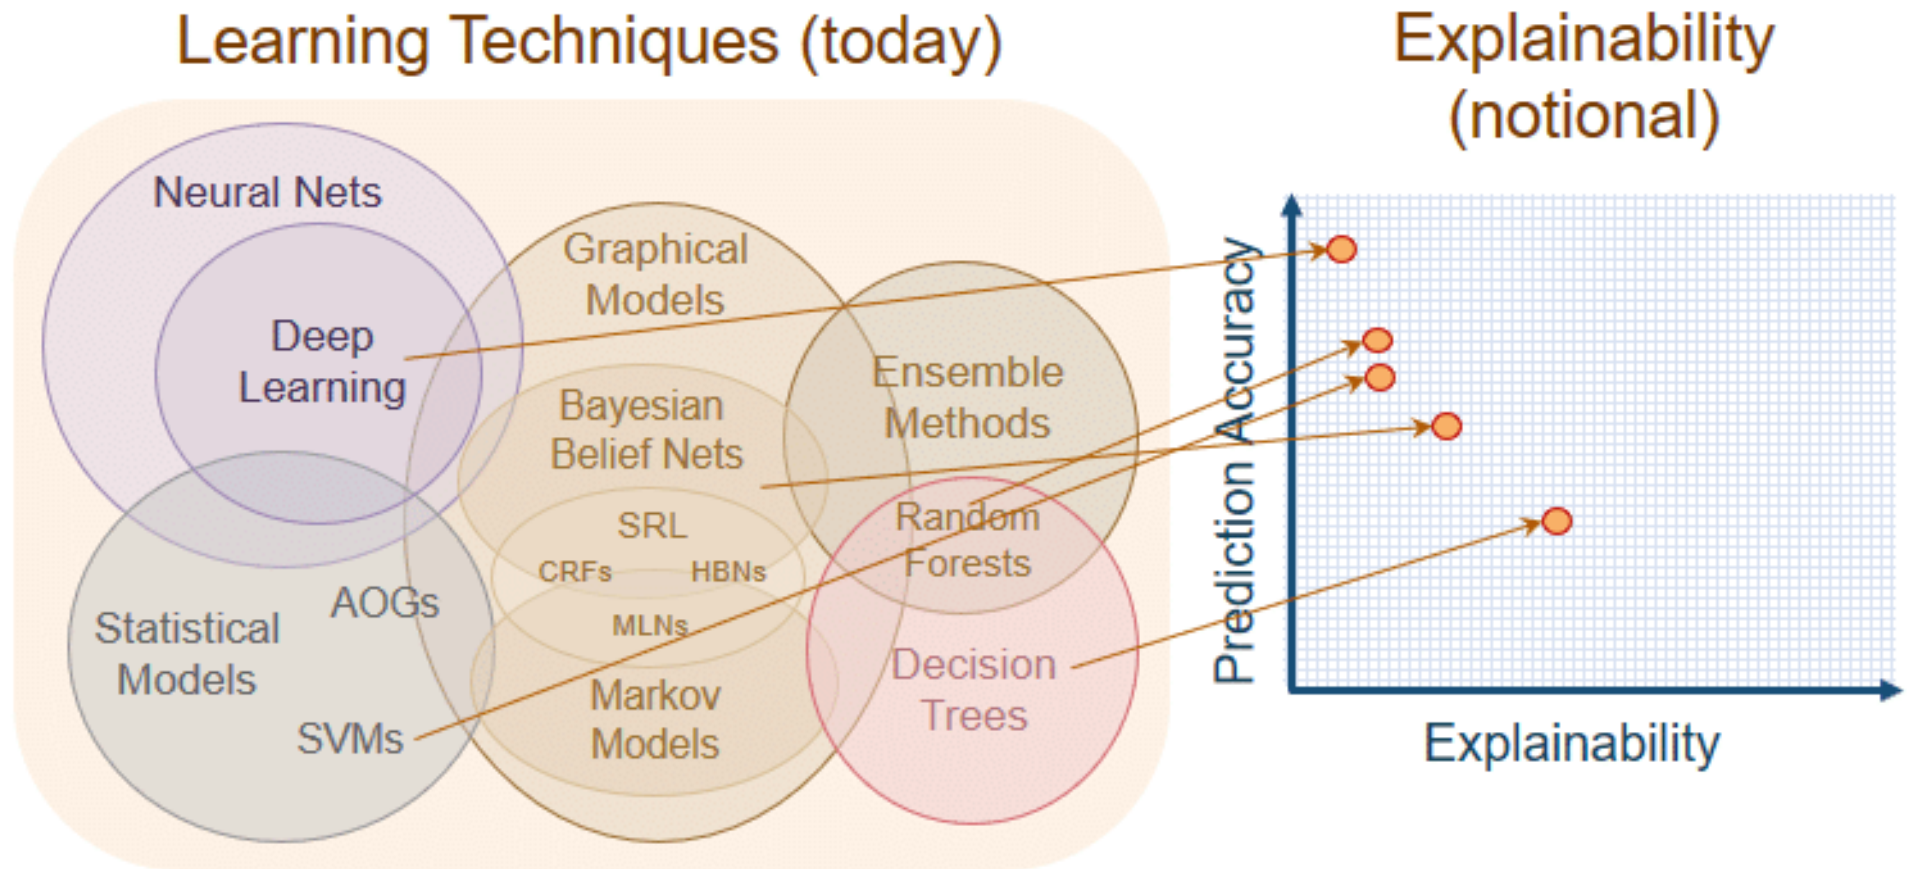

Thomas Bayes  
1702 - 1761

## But Accuracy Matters ...

# Towards Model-Agnostic Approaches

- Why model-agnostic?
- We want to use more powerful methods (ex. Deep Learning)
- Producing better explanations independently of the model

## Local Interpretable Model-agnostic Explanations (LIME)

- First, but still popular, MA-XAI algorithm (Ribeiro et al., 2016)
- Simple and flexible idea working with categorical or continuous data, text, images (and open-source library)
- Given instance  $x$ , train surrogate model on a neighbourhood of  $x$
- The ML algorithm annotates the neighbour instances
- Locality (neighbours) makes linearity a tenable assumption

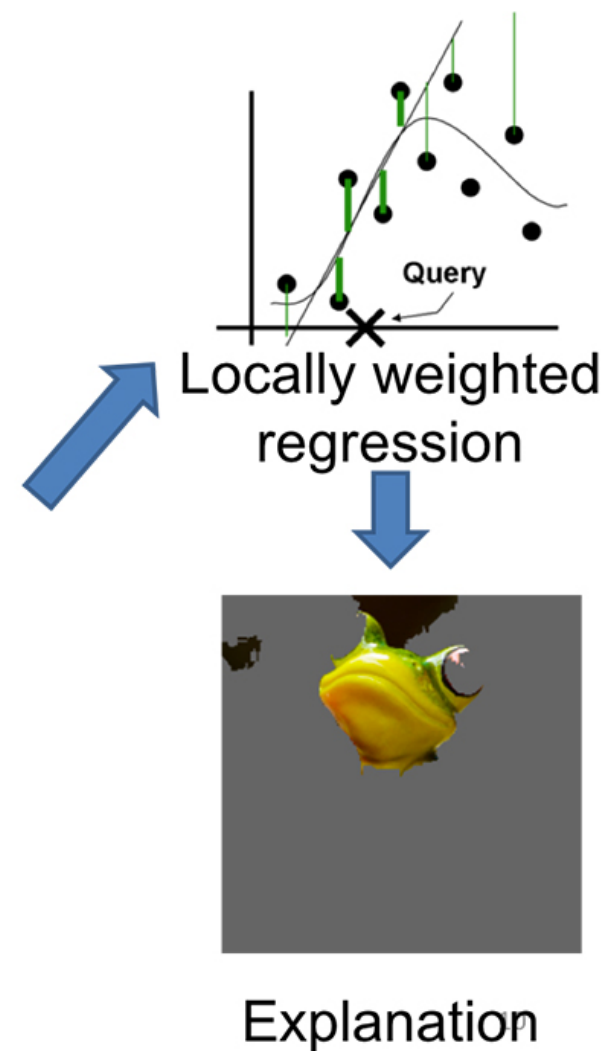

## How LIME works

Original Image  
 $P(\text{tree frog}) = 0.54$

Perturbed Instances	$P(\text{tree frog})$
	 0.85
	 0.00001
	 0.52

## LIME Examples: Image Recognition

- Google Inception Network for Image Recognition
- Best classification outputs:
  - $P(\text{Electric Guitar}) = 0.32$  (Why? Lime? Fretboard)
  - $P(\text{Acoustic Guitar}) = 0.24$
  - $P(\text{Labrador}) = 0.21$

(a) Original Image

(b) Explaining *Electric guitar*

(c) Explaining *Acoustic guitar*

(d) Explaining *Labrador*

## LIME Examples: Image Recognition

- Husky vs Wolf ?
- IF Snow THEN Wolf ...

(a) Husky classified as wolf

(b) Explanation

## LIME Examples: Text Recognition

- Newsgroups (Old) Dataset
- Christian vs. Atheist ...

Subject: Another request for Darwin Fish  
Organization: University of New Mexico, Albuquerque  
Lines: 11  
NNTP-Posting-Host: triton.unm.edu

Hello Gang,

There have been some notes recently asking where to obtain the DARWIN fish.

This is the same question I have and I have not seen an answer on the net. If anyone has a contact please post on the net or email me.

## SHapley Additive exPlanations (SHAP) (Lundberg & Lee 2017)

- Another Model Agnostic Method
- Any kind of data and open source
- Shapley values? Game-theoretic concept: each actor gains as much or more as they would have from acting independently
- Let's explain the (explanation) model by a simple example ...

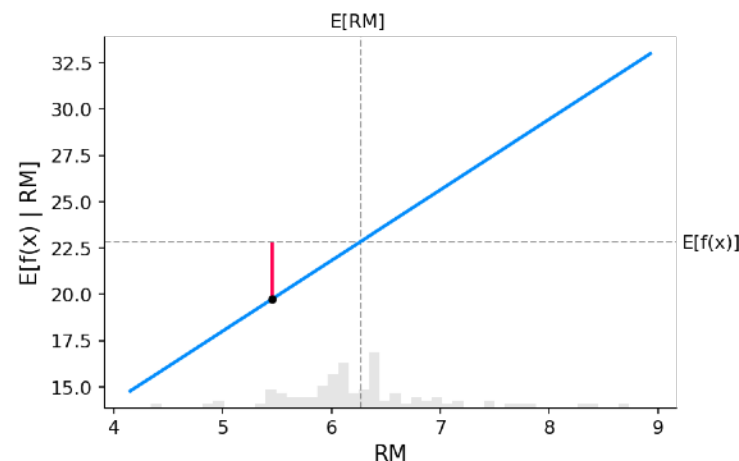

The Boston housing prices dataset has an ethical problem. You can refer to the documentation of this function for further details.

The scikit-learn maintainers therefore strongly discourage the use of this dataset unless the purpose of the code is to study and educate about ethical issues in data science and machine learning.

## Boston Housing Data to understand SHAP

- Simple Linear Regression on the Boston Housing Data Set (506 regions, 14 features, median home price as target value)
- Coefficients are not so transparent (different scales)
- Partial dependence more informative, Shapley value is just the gap

1. CRIM - per capita crime rate by town
2. ZN - proportion of residential land zoned for lots over 25,000 sq.ft.
3. INDUS - proportion of non-retail business acres per town.
4. CHAS - Charles River dummy variable (1 if tract bounds river; 0 otherwise)
5. NOX - nitric oxides concentration (parts per 10 million)
6. RM - average number of rooms per dwelling
7. AGE - proportion of owner-occupied units built prior to 1940
8. DIS - weighted distances to five Boston employment centres
9. RAD - index of accessibility to radial highways
10. TAX - full-value property-tax rate per \$10,000
11. PTRATIO - pupil-teacher ratio by town
12. B -  $1000(B_k - 0.63)^2$  where  $B_k$  is the proportion of blacks by town
13. LSTAT - % lower status of the population
14. MEDV - Median value of owner-occupied homes in \$1000's

### Model coefficients:

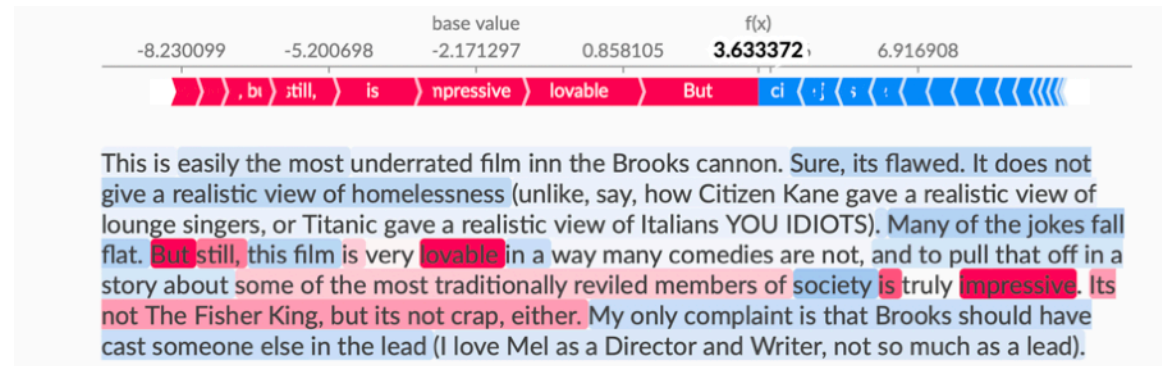

CRIM = -0.108  
 ZN = 0.0464  
 INDUS = 0.0206  
 CHAS = 2.6867  
 NOX = -17.7666  
 RM = 3.8099  
 AGE = 0.0007  
 DIS = -1.4756  
 RAD = 0.306  
 TAX = -0.0123  
 PTRATIO = -0.9527  
 B = 0.0093  
 LSTAT = -0.5248

## Understanding Shapley Values

- Shapley value computed for each feature (less trivial but possible for general ML algorithms)
- Their sum is the difference between the baseline expected model output and the current model output
- This allows to explain the impact on a particular result
- Same additive property can be kept on non-linear models

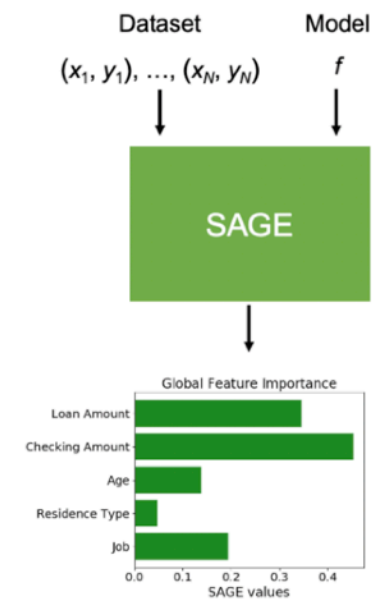

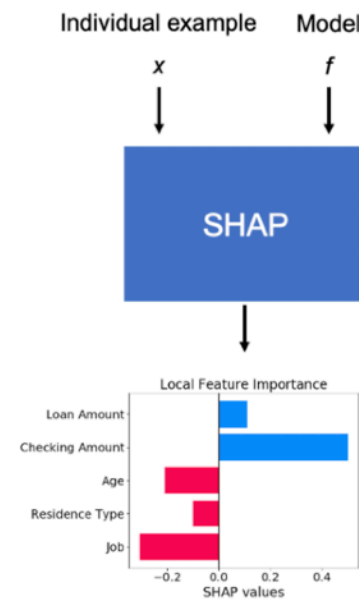

## Some SHAP Examples

## Shapley Additive Global Importance (SAGE) (2020)

- Very recent (Covert et al., 2020) extension of SHAP towards global explanations
- Still based on Shapley values
- SHAP answers the question how much does each feature contribute to this individual prediction?
- SAGE answers the question how much does the model depend on each feature overall?
- Local (SHAP) vs. Global (SAGE)

## Counterfactual Explanations

- Causal analysis distinguishes between observations and interventions  
 $P(X|y) \neq P(X|\text{do}(y))$
- This allows for WHAT-IF reasoning: if an input datapoint was  $x$  instead of  $x'$ , then a ML output would be  $y$  instead of  $y'$
- Counterfactual Probabilities  
 $P(y_x | y', x') := P(y | x', y', \text{do}(x))$
- Pearl's Causal Models allow to compute CFs (in general only partially identifiable)

## A Counterfactual Analysis in Palliative Care

Study of terminally ill cancer patients' preferences wrt their place of death (home or hospital)

A causal model (BN)  
based on expert  
knowledge and data

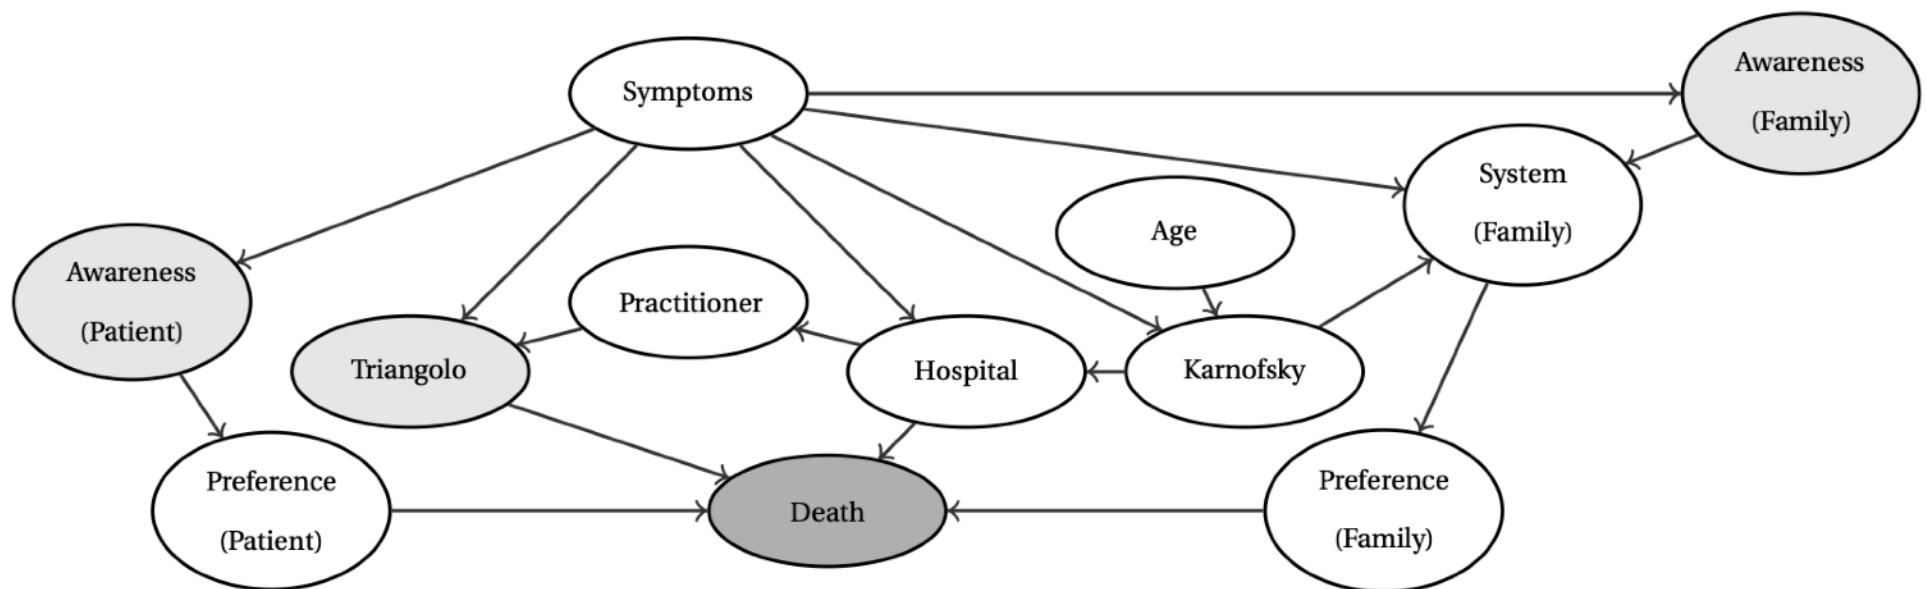

**Impact on place of death in cancer patients: a causal exploration in southern Switzerland**  
Heidi Kern <sup>1</sup>, Giorgio Corani <sup>2</sup>, David Huber <sup>2</sup>, Nicola Vermes <sup>2</sup>, Marco Zaffalon <sup>2</sup>,  
Marco Varini <sup>3</sup>, Claudia Wenzel <sup>4</sup>, André Fringer <sup>5</sup>

## A Counterfactual Analysis in Palliative Care

most patients prefer to die at home,  
but a majority actually die in institutional settings

**interventions** by health care professionals that can facilitate dying at home?

## A Counterfactual Analysis in Palliative Care

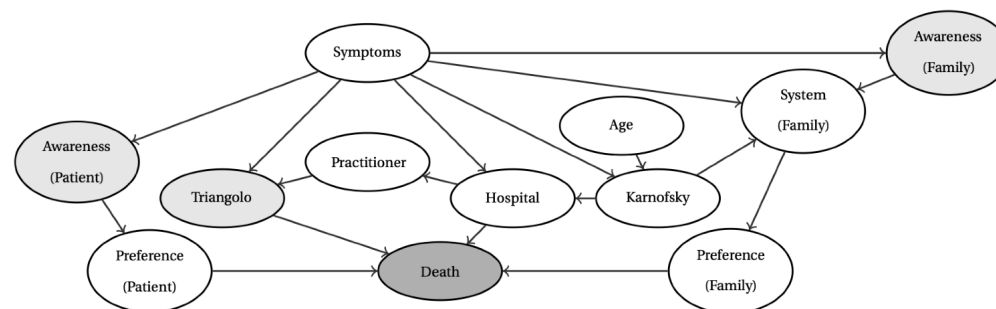

- Finding the most important variable on which to act
- Importance by probability of necessity and sufficiency

$$PNS := P(Y_{X=1} = 1, Y_{X=0} = 0)$$

$$PNS(\text{Triangolo}) \in [0.30, 0.31]$$

$$PNS(\text{Patient\_Awareness}) \in [0.03, 0.10]$$

$$PNS(\text{Family\_Awareness}) \in [0.06, 0.10]$$

A Co

- Fir

va

- Im

ne

*PNS*

One should act on Triangolo first: for instance, by making Triangolo available to all patients, we should expect a reduction of people at the hospital by 30%

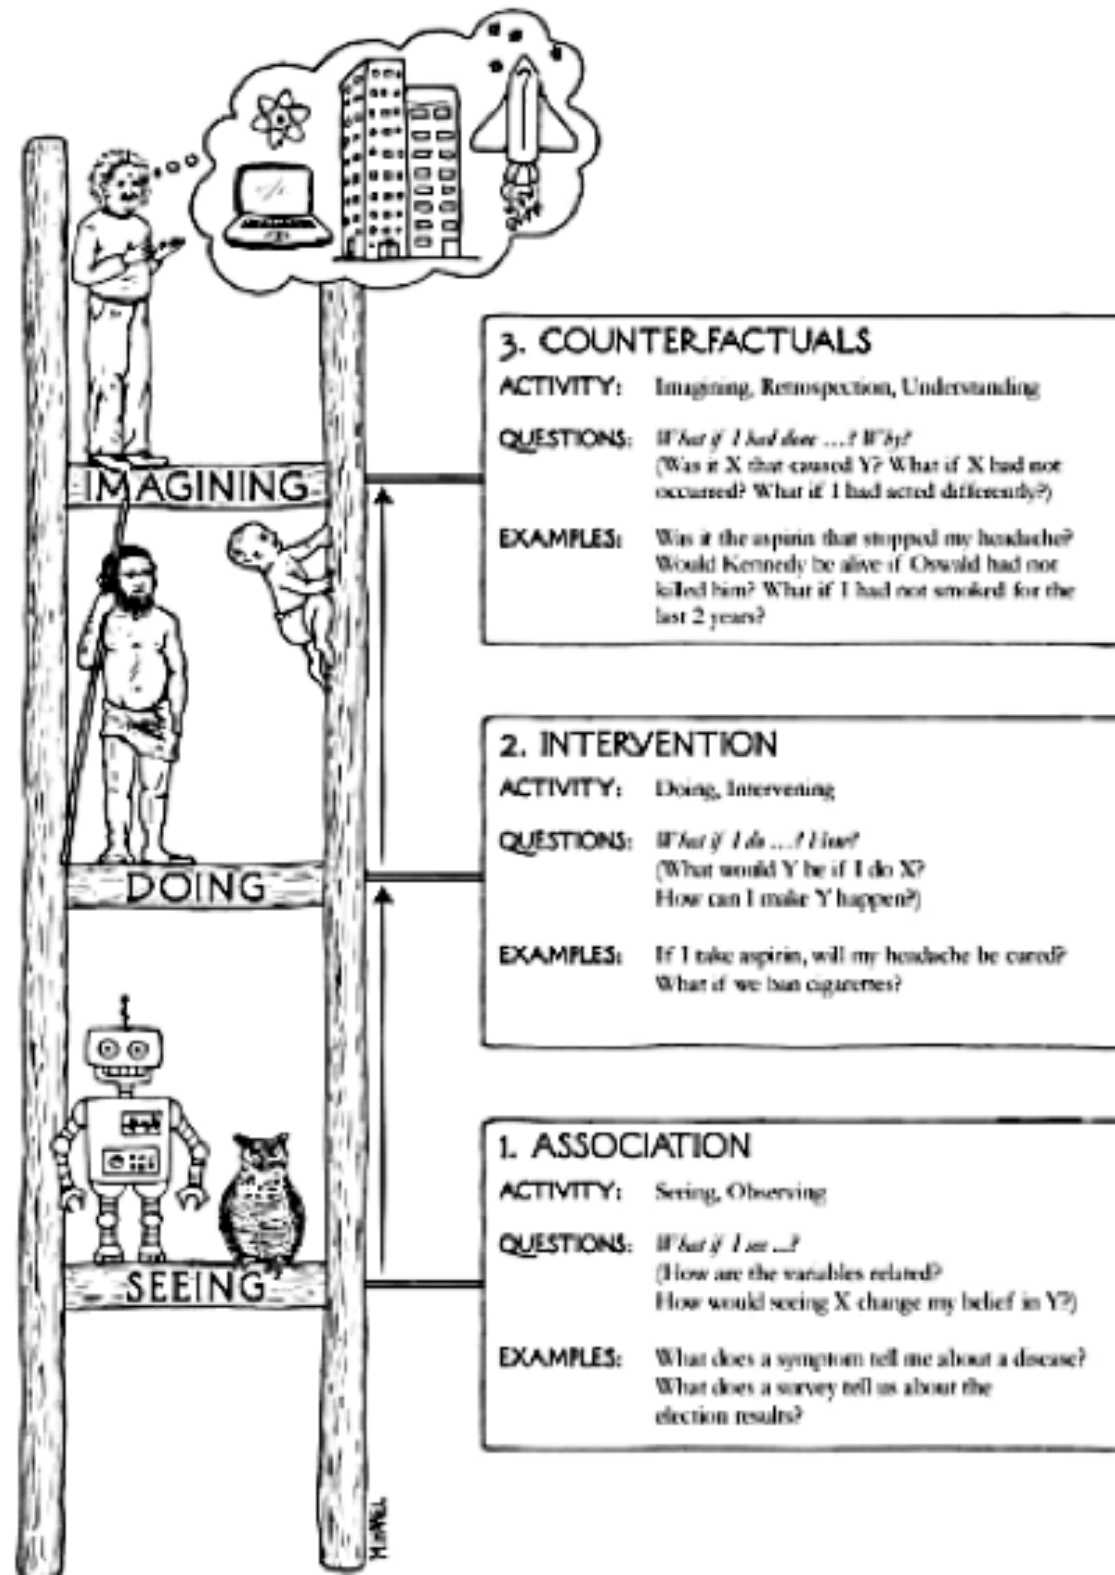

This would save money too, and would allow politicians to do economic considerations as to which amount it is even economically profitable to fund Triangolo, and have patients die at home, rather than spending more to have patients die at the hospital

# Pearl's Ladder of Causation

## Explaining Reinforcement Learning

- Agent operating in state space  $\mathcal{S}$
- Set of actions  $\mathcal{A}_s$
- Q-value function  $Q(s, a)$  available for each  $s \in \mathcal{S}$  and  $a \in \mathcal{A}_s$
- Greedy agent  $\hat{a} = \arg \max_a Q(a, s)$
- For each feature  $f$  compute its saliency  $S[f]$
- $s'$  perturbation of  $s$  obtained by changing the value of  $f$
- $S[f]$  corresponds to the Q-value change
- E.g., Iyer (2018):  $S[f] = Q(s, \hat{a}) - Q(s', \hat{a})$
- Alternatives have been proposed

## Explainable Reinforcement Learning by Saliency Maps

- Saliency maps can be created by means of the computed saliency levels

(b) Iyer et al. (2018)

(c) Greydanus et al. (2018)

(d) SARFA

# Strategic Training by XRL

(a) Chess board

Figure 5.6: Saliency map for NTW

## Concluding Remarks

- Interpretable Machine (and Reinforcement) Learning is an important open challenge for contemporary AI
- Tools/libraries are already available
- Explaining your ML model does not require to trade-off your accuracy
- Causal analysis as the ultimate
